

Product components

Components	Component number	Size-1	Size-2
		100 U	500 U
E. coli Poly(A) Polymerase (5,000 U/mL)	RM20564	20 µL	100 µL
10X Poly(A) Polymerase Reaction Buffer	RM20806	1.5 mL	1.5 mL
ATP(10 mM)	RM20159	200 µL	200 µL

Product Description

Poly(A) polymerase catalyzes the addition of AMP, converted from ATP, to the 3' end of RNA in a template-independent manner.

Source

Derived from an Escherichia coli strain carrying the Poly(A) polymerase gene cloned from E. coli.

Applications

- Labeling RNA with ATP or cordycepin.
- Adding Poly(A) tails to RNA for cloning or affinity purification.
- Increasing mRNA stability to enhance translation efficiency in eukaryotic cells after transfection.

Activity Definition

One unit is defined as the amount of enzyme required to catalyze the incorporation of 1 nmol of AMP into RNA in 10 minutes at 37°C in a 20 µl reaction mixture.

Storage Buffer

20 mM Tris-HCl, 300 mM NaCl, 1 mM DTT, 1 mM EDTA, 50% Glycerol, 0.1% (w/v) Triton® X-100, pH 7.5 @ 25°C

Store

-20°C

Inhibition and Inactivation

Inactivate at 80°C for 15 min

Protocol

1. Add the following reaction components on ice according to the table below (example for a 20 µL reaction volume):

Reagent	Volume
10X E. coli Poly(A) Polymerase Reaction	2 µL
ATP (10 mM)	2 µL
E. coli Poly(A) Polymerase	1 µL
RNA (1-10 µg)	10 µL
ddH ₂ O	To 20 µL

- Mix all reaction components thoroughly and briefly centrifuge to collect the solution at the bottom of the tube.
- Incubate at 37°C for 30 minutes.
- Heat inactivate by incubating at 85°C for 15 minutes or add EDTA to a final concentration of 10 mM.
- RNAase inhibitor can be added to enhance RNA stability in the solution, with a 1X concentration of 1 U/µL.
